RE: CTS Rapid Set Concrete Pour for road pits, on Friday 19<sup>th</sup> June 2015

To Whom It May Concern,

Eifers Civil engaged Volumetric Concrete Australia to provide a structural rapid setting concrete that had to be poured around a new composite pits installation and that was able to be poured onsite once pit installation was completed for VicRoads on the On Ramp to the Bolte Bridge & Westgate freeway.

There were 12 Pits replaced and approximately 12m<sup>3</sup> poured over the 4 week period, that which the project had a range of requirement to be met.

- Works to be completed at night and the concrete standing by ready to be poured as soon as the pit lids were installed
- The concrete to have a structural strength of the 40mpa before road opening, which was achieved in 4 hrs
- Road Re-opening to be no later than 10am
- No disruption to traffic

Using their mobile batching plant trucks and CTS Rapid Set Cement VCA were able to have concrete standing by ready to produce fresh concrete as it was needed and with the super impressive CTS Rapid Set Concrete completely these tasks & requirements ahead on time which allowed the safe re-opening of the freeway ahead of schedule.

Eifers Civil highly recommends the use of products and services of Volumetric Concrete Australia. These products and services allow Eifers Civil to complete time critical projects, and we well be using these services again in the close future.

If you have any questions about the project please contact the person below
